Photoelectrons produced by absorption of x-rays. A. Basin, *J. Expd. Theor. Phys.* (U. S. S. R.) 14, No. 1-2, 23-9 (1947).—The x-ray photoelectron spectra of 7 elements are investigated by means of the magnetic spectrometer and a Geiger-Müller counter. The method by which the relative probabilities of absorption of x-rays in different energy levels of atoms are deduced, by measurements of the relative intensities of the lines of the electron spectra is described. Preliminary expd. results show that the relation between the probability of absorption in various levels depends to a considerable degree on the relation between the wave length of the incident x-rays and the wave length of the limit of absorption of the given level. Comparison of these electron spectra with the photometric spectral curves of Robinson and Cassie (*C. A.* 21, 702) shows that the new method is more satisfactory for a determination of relative intensities. The relative probabilities of absorption by the  $L_1$ ,  $M_1$ ,  $N_1$  and  $P$  electron levels are found to be  $S_1/K_1/L_1/M_1 = 11.3$ ;  $Cr$ ,  $K/L_1/M = 9.4$ ;  $Se$ ,  $L/M_1 = 1.1$ ;  $Ag$ ,  $L/M = 3.0$ ,  $L/M + N = 2.1$ ;  $L/N = 11.0$ ;  $Sb$ ,  $L/M/N = 1.8$ ;  $Mn$ ,  $Mn_1/Mn_2$  ( $Mn_1/Mn_2 = 23.6$ ;  $24.0$ ;  $37.4$ ;  $28.0$ ),  $M/N = 4.6$   $M/O = 5.5$ ,  $N/O = 1.2$ ,  $M/N + O = 2.5$ ;  $Bi$ ,  $M/N = 0.48$ ,  $N/O + O = 0.24$ .

AUTHOR: Basin, A. P.

TITLE: Effect of 25-Mev bremsstrahlung of a betatron and of 14-Mev neutrons on the electrical conductivity of dielectric polymers

PERIODICAL: Fizika tverdogo tela, v. 4, no. 10, 1962, 2885-2889

TEXT: The electrical conductivity of Ftoroplast-3 and-4, polyethylene, polystyrene and polyethylene-terephthalate (Lavaan) specimens produced by vacuum condensation was studied. This conductivity was brought about by bremsstrahlung and Neutron irradiation from a  $H^3(d,n)He^4$  source. The main action of the betatron radiation in polymers is based on Compton scattering and pair production. The radiation chemical process comprises ionization and excitation of the molecules, dissociation and rupture of the chemical bonds, formation of free radicals which finally interact among with one another and with other molecules. The end result is either destruction, i. e. the molecular chains remain shortened, or a

Card 1/3

S/181/62/004/010/038/063  
Effect of 25-Mev bremsstrahlung of a ... B102/B112

lacing effect, i. e. the free radicals attach themselves to the ramifications of the primary structure. The volume resistance of the specimens before and after irradiation, the irradiation-induced emf and the irradiation-induced electrical conductivity of the specimens were measured, all at 20°C using the conventional methods. Irradiation was made in the vacuum. The doses D were  $\sim 10^8$  r for 25-Mev bremsstrahlung, the integral flux was  $10^{11}$  cm<sup>-2</sup>. In all cases irradiation made the volume resistivity drop by almost one order of magnitude, except for Laysan where it increased from  $1.45 \cdot 10^{17}$  to  $7.8 \cdot 10^{17}$  ohm·cm in consequence of the exposure to bremsstrahlung. The curve  $\sigma = f(\log D)$  shows an exponential decrease for Ftoroplast-4. For Ftoroplast-3 and -4, and polyethylene the curves  $\log E_{in} = f(r)$  were recorded; after a certain dose rate (r) the induced emf ( $E_{in}$ ) rise rapidly with a tendency to saturation.  $\log \sigma = f(r)$  at constant D and  $\log \sigma = f(D)$  at constant r of Ftoroplast-3, a polar dielectric, was measured. It is found that  $\sigma$  first decreases in jumps by 2 to 3 orders of magnitude, then it increases

slightly, and finally it takes on a constant value which depends on D.  
The effects observed are irreversible. There are 7 figures and 1 table.

AUTHORS: Kaplan, S. Z.; Basin, A. P.; Breydo, Te. G.; Spirina, I. F.

TITLE: Effect of bremstrahlung from a betatron with 25 mev energy and ultraviolet rays on mineral oils

SOURCE: Khimiya i tekhnologiya topliv i masel, no. 8, 1963, 57-61.

TOPIC TAGS: bremstrahlung, betatron, ultraviolet ray, lubricating oil, mineral oil, betatron irradiation.

ABSTRACT: Authors studied some physico-chemical processes which take place in mineral lubricating and electric insulating oils under the influence of electromagnetic radiation. The average effective radiation of the betatron was 9.5 kev. The effect of retardation of the betatron irradiation on turbine lubricants which were concentrated with polymers was studied by applying a maximum energy of 25 mev of a dose of  $10^5$ - $10^7$  and ultraviolet radiation. It was found that when the irradiation is performed in a closed system with an inadequate supply of air, the oxidizing numbers of concentrated oils were decreased. Their viscosity did not change however. The lowering of intensity in the absorption bands corresponding to the vibrations of the groups -CH<sub>2</sub> and -CH<sub>3</sub> were observed in the infrared

Card 1/2

L 17529-63

ACCESSION NR: AP3004535

spectra of the oil irradiated by the betatron. However, after irradiation with the ultraviolet light, the intensity of these bands increased. When the irradiation is performed in an open vessel with a transformer oil using a dose of  $10^6$  r, the oxidizing number of the oil increases and the electric insulating properties are decreased. As a result of the irradiation, Beta-active isotopes  $\text{Fe}^{55}$  and  $\text{Na}^{24}$  appear in the oil. Orig. art. has: 3 tables and 5 figures.

TITLE: The effect of small doses of Gamma-rays and neutrons on the aging of oils

SOURCE: Khimiya i tekhnologiya topliv i masel, no. 6, 1966, 21-23

TOPIC TAGS: transformer oil, bremsstrahlung, gamma irradiation, neutron irradiation, petroleum, solution acidity, lubricant viscosity, lubricating oil, dielectric property, nonmetal aging

ABSTRACT: The authors study the initiating action of gamma-rays and neutrons on the aging of petroleum oils in contact with structural materials. The results of experiments on the study of the influence of the bremsstrahlung from a 25-Mev betatron on the dielectric properties of transformer oil (GOST 982-56) in contact with active oxidation catalysts (copper and copper oxide), and the influence of fast neutrons (Po-Be) on the viscosity and oxidation number of No. 22 turbine oil with and without a 5% addition of polyisobutylene during storage in steel containers. The initiating dose amounted to 500 r. It was found that transformer oil subjected to a short-term irradiation (475 rad) ages faster than non-irradiated oil during prolonged contact with copper or copper oxide in air. On irradiation with fast neutrons ( $10^9$  neutr/cm<sup>2</sup>) and subsequent prolonged storage of No. 22 turbine oil with and without 5% polyiso-

TITLE: An induction dynamometer for measuring soil stresses. Class 42, No. 171610

SOURCE: Byulleten' izobreteniij i tovarnykh znakov, no. 11, 1965, 89

TOPIC TAGS: electronic measurement, soil mechanics, stress measurement

ABSTRACT: This Author's Certificate introduces: 1. An induction dynamometer for measuring soil stresses. The instrument contains a source of current and a meter. The measurement accuracy is improved and the size of the instrument is reduced by placing the induction coil in an annular form. The core of the coil is made of laminated iron. The core is divided into two parts which are joined together. The dynamometer is such provision is made for transmitting plane-parallel deformation. The coil consists of two parallel sets of turns in the form of a spiral. The outer set of turns is wound on the outer part of the core, and the inner set of turns is wound on the inner part of the core. The coil is fastened to the outer part of the core and the inner part of the core is fastened to the inner part.

TITLE: Simulators of contamination

19

SOURCE: Tekhnika i vooruzheniye, no. 2, 1966, 30-31

TOPIC TAGS: radiation simulation, radioactive contamination, CW detection equipment, x-ray meter, radiation simulator / IP-3 radiation simulator, IP-08 radiation simulator, DP-3 x-ray meter D-09 x-ray meter

ABSTRACT: A description is given of simulators of radiation and chemical detection devices for the armed forces, which make it possible to avoid the use of radioactive and toxic substances. The IP-3<sup>20</sup> radiation simulator is in a 140 x 170 x 90-mm box and controls the readings of a DP-3 x-ray meter. Simulator operation is based on the principle of a self-exciting multivibrator using an ESS-82 double-triode. The latter has a current feedback in the cathode circuit and a voltage current in the plate circuit of the first triode and in the control grid of the second. From the plate of the

Card 1/3

L 44136-66

ACC NR. AP6022402

second triode, the pulses are transmitted along a coupling cable to the pulse-shaping circuit of the x-ray meter. At the circuit output the simulator sums the pulses and transmits them to a microammeter whose scale is calibrated in proportion to the number of pulses, and, consequently, to the dose rate which varies from 0.2-150 r/hr. The IP-08<sup>10</sup> radiation simulator is designed to simulate radioactive contamination. It is used in training for radiation-detection operations and in the use of the D-08<sup>10</sup> x-ray meter. The principle of operation of the IP-08 is based on simulation of the ionization-chamber current transmitted along the control grid resistors of a d-c amplifier. Variations in voltage caused by the amplifier result in a proportional variation of the voltage in the ionization chamber and, consequently, in a simulation of the dose rate. The ionization-chamber current performs simulation by means of a voltage divider whose circuit is connected with the x-ray meter resistors with a resistibility ten times higher than that of the corresponding resistors of the simulator. The simulator is assembled in a 85 x 125 x 55-mm box and measures power rates from 0-300 r/hr. The IS-GSP<sup>10</sup> contamination simulator is designed to control the light and sound signaling of the GSP-1 gas alarm. The simulator, which is in a

"Za Ekonomiyu Topliva" No 2

Subject furnaces are characterized by large waste  
of water and salts through escaping steam. This  
requires frequent filling of boilers. Describes  
a method whereby various components of steam are  
trapped and condensed water is led back to the

Title : Mechanization of cast iron-ware casting

Periodical : Lit. proizv. 4, 17-18, July 1954

Abstract : The economical advantages derived by the mechanization of cast iron-ware casting processes (manufacture of cast iron kitchen utensils), are described. The mechanization included the introduction of a conveyor method of moulding, pouring and extrusion of casts. Drawing.

TITLE: An algorithm of Armenian-Russian machine translation. (Machine transla-  
tion) /b

SOURCE: Problemy kibernetiki, no. 14, 1965, 221-244

TOPIC TAGS: translation algorithm, machine translation, syntactic analysis,  
syntactic synthesis, idiom identification

ARTIFACT: The algorithm for Armenian-Russian machine translation whose general description is given in this article is based on the principle of independent analysis and synthesis. This means that during the first stage of analysis the grammatical and semantic analysis of the Armenian text is carried out by the means of the grammatical and semantic analysis of the Armenian language, while during the second it synthesizes the corresponding rules of the target language. The authors outline the principles of the information retrieval during the analysis, the methods of morphological analysis of the words, the use of the dictionary and the method of morphological analysis of the words at the

Card 1/2

ACCESSION NR: AP5017613

tence and describe the labels used by the algorithm during the syntactic analysis and label synthesis. They also describe procedures for arriving at the correct meaning of multiple meaning words and for the identification of idioms. The article concludes with four examples of translation of mathematical texts. The authors are V. A. Kostylev, V. S. Kulagin, I. A. Mel'chuk, T. N. Moloshnaya and V. A. Ogneshchikov. The article is intended for translators and mathematicians.

SOURCE: Problemy kibernetiki, no. 14, 1965, 245-266

TOPIC TAGS: translation algorithm, machine translation, sentence coding

ABSTRACT: This is the second part of a paper describing an algorithm for automatic sentence-to-sentence translation developed at the Institute of Mathematics of the Armenian Academy of Sciences. The basic principle of the algorithm is to use a two-level memory system consisting of a 1024-cell inner memory and a 4096-cell outer memory. The basic principles or all the concepts utilized are due to O. S. Kulagina (Problemy kibernetiki, no. 2, 1959, 289-302). A detailed description of the hardware and the method of sentence coding is followed by a description of the scheme of the algorithm and of all the auxiliary information. A brief summary of the master and interpretation programs is also

TITLE : Use of Alginate in the Preparation of Emulsions Containing Castor and Paraffine Oils  
ORIG. PUB. : Arkhiv farmats., 1957, 7, No 2, 78-78  
  
ABSTRACT : Described is a method of emulsion preparation with the employment of Na-Alginate as a stabilizer, applicable in the apothecary conditions. Presented are results of the experiments involving the preparation of stable emulsions with paraffine oil, having pleasant taste. --A.Slonimskaya.
